Limitations and Future Work

9 Conclusion

While the evaluation results are very promising, we consider

In an appified smart home, there exists rich semantic infor-

this work a first step towards semantics-aware anomaly de-

mation, such as smart apps, configurations, device types, and

tection in appified smart homes. HAWatcher has some limi-

installation locations. It is a promising direction to combine

tations that we plan to address.

such semantic information with mining for anomaly detec-

tion. We presented a viable and effective approach in this

User Activity Deviations. Correlations due to the user ac-

direction: it exploits semantics on different channels (smart-

tivity channel are useful for detecting anomalies, but they

can cause false alarms when there are user-activity deviations (e.g., app, physical, and user-activity) to propose explainable hypotheses. We already find such cases during our evaluation (see Appendix A, Table 1, for hypothetical correlations, which are tested using event logs and the False Alarm Rate in Section 6.4), although they occur rarely. We refined by smart apps. We built a prototype HAWatcher and evaluated it on four real-world testbeds against various scenarios (e.g., the front door is left open), while others may be annoying. We found 62 anomaly cases, demonstrating its high accuracy and low false alarm rate. For example, one day a resident wants to read a book in her bedroom and turns on extra lights, which causes illuminance high. If this never or rarely occurs during training, it can cause a false alarm. One potential solution is to ask for users' feedback when raising alarms, and deactivate or re-test correlations that have caused negative feedback. Generally, how to continuously update correlations to adapt to changes of user activities and IoT devices and user activities is an important problem.

Long-term Correlations. HAWatcher can only mine correlations whose anterior and posterior events arise within short intervals. Long-interval correlations, such as the rela-
